1.0 EXECUTIVE SUMMARY

The purpose of this report is to evaluate the potential traffic impacts related to the proposed East Robinson Residential Development. Within this report, the operating characteristics of the proposed access points and impacts to the adjacent roadway network are evaluated. To define traffic impact, this analysis establishes existing baseline traffic conditions, projects background traffic flow including area growth, and determines the traffic operations that would result from the proposed project.

This report is an update of the April 2024 traffic impact report for the same project. The April 2024 report provided analysis for 232 units of senior housing (attached) and 24 units of townhomes/duplexes, whereas this report provides analysis for 232 units of senior housing (attached) and 40 units of senior housing (single family/townhome). Additionally, this report addresses feedback from the Amherst Traffic Safety Board relative to anticipated traffic distribution towards the north and the Creekwoods Neighborhood.

Project Location and Description

The project site is located at 3880-3910 East Robinson in the Town of Amherst, Erie County, NY. The project comprises the following aspects:

- **Site Status:** The site is currently undeveloped.
- **Zoning:** General Business District.
- **Site Boundary:**
 - **North:** Private access road.
 - **East:** Naples Lane.
 - **South:** East Robinson Road.
 - **West:** Tops Plaza.
- **Vicinity Land Uses:** There is a mix of land uses, including residential, commercial, and service.

The project comprises the following components:

- **Proposed Land Uses:**
 - **Senior Housing (Single Family):** 40 units within five separate buildings.
 - **Senior Housing (Multifamily):** 232 units within two separate buildings (116 units each).
- **Access:** Access to the site will be provided via new driveways along East Robinson Road with cross access onto Naples Lane. Naples Lane traffic can access Niagara Falls Boulevard via the existing traffic signal servicing Wegmans and Delta Sonic.
- **Sidewalks:** Sidewalks are planned throughout the site with connections to East Robinson Road and the private access road to the north.

The Concept Site Plan prepared by Carmina Wood Design is included at the end of this report.

Study Area

To ensure a comprehensive analysis of potential traffic impacts, a study area was selected consisting of the following intersections.

- Niagara Falls Boulevard at Delta Sonic and Wegmans
- Niagara Falls Boulevard at East Robinson Road
- East Robinson Road at Naples Lane

May 15, 2024

Existing and Background Conditions

Passero Associates collected turning movement traffic counts on Tuesday, March 12, 2024. Traffic counts were conducted from 7:00 to 9:00 AM and 4:00 to 6:00 PM to determine peak hour traffic volumes at the study intersections. All traffic counts were collected on a typical weekday while local schools were in session. No significant adverse weather conditions impacted the traffic counts.

Background traffic volumes represent the traffic conditions during the proposed build year without development of the project. Construction of the proposed project is anticipated to reach full build-out within three years. Local municipal personnel were contacted to discuss any other specific projects that are currently approved or under construction that would generate additional traffic in the study area. No nearby projects were identified. To account for normal increases in background traffic growth, including any unforeseen developments in the study area, a growth rate of 0.5% per year was applied to the existing traffic volumes.

Conclusions and Recommendations

This Traffic Impact Report identified and evaluated the potential traffic impacts that can be expected from the proposed East Robinson Residential project. The results of this comprehensive study determined that the existing transportation network can adequately accommodate the projected traffic volumes and resulting minor impacts to study area intersections. The following sets forth the study's conclusions and recommendations:

1. The proposed project consists of constructing a mix of senior housing (232 units) and townhomes/duplexes (40 units). Access to the site will be provided via new driveways along East Robinson Road with cross access onto Naples Lane. Naples Lane traffic can access Niagara Falls Boulevard via the existing traffic signal servicing Wegmans and Delta Sonic.
2. Sidewalks are proposed throughout the site with proposed off-site connections provided to Wegmans to the north, the Tops Plaza to the west, and the existing sidewalk along East Robinson Road to the south.
3. The proposed project is expected to generate approximately 22 entering/43 exiting vehicle trips during the AM peak hour and 45 entering/35 exiting vehicle trips during the PM peak hour.
4. Section 4.4 describes the results of the crash investigation. Rear end crashes were the predominant crash type at the intersection of Niagara Falls Boulevard and East Robinson Road. Crashes of this nature are characteristic of signalized intersections with moderate to high traffic volumes. There are no recommended geometric strategies for improvement of the existing condition. This is an existing condition that, if addressed, should be undertaken by the Town and/or NYSDOT.
5. Very minor increases in delays are projected under full build conditions during the peak hours at the existing study intersections. The proposed project constitutes less than 0.89% of total peak hour traffic during either peak hour at the signalized intersections of Niagara Falls Boulevard at Delta Sonic/Wegmans and East Robinson Road. The additional traffic volumes generated by the proposed project can be accommodated. Therefore, no improvements are warranted nor recommended under full build conditions.
6. The proposed driveways are projected to operate at LOS B or better during the AM and PM peak hours. No capacity improvements are warranted nor recommended under full build conditions.

2.0 INTRODUCTION

2.1 Study Purpose and Objectives

The purpose of this report is to evaluate the potential traffic impacts related to the proposed East Robinson Road Development. Within this report, the operating characteristics of the proposed access point and impacts to the adjacent roadway network are evaluated. Mitigating measures are identified, if needed, to minimize operational concerns. To define traffic impact, this analysis establishes existing baseline traffic conditions, projects background traffic flow including area growth, and determines the traffic operations that would result from the proposed project. All figures and supporting calculations are included at the end of this report.

2.2 Project Location

The project site is located at 3880-3910 East Robinson in the Town of Amherst, Erie County, NY. The project comprises the following aspects:

- **Site Status:** The site is currently undeveloped.
- **Zoning:** General Business District.
- **Site Boundary:**
 - **North:** Private access road.
 - **East:** Naple Lane.
 - **South:** East Robinson Road.
 - **West:** Tops Plaza.
- **Vicinity Land Uses:** There is a mix of land uses, including residential, commercial, and service.

2.3 Study Area

To ensure a comprehensive analysis of potential traffic impacts, a study area was selected consisting of the following intersections. The project site location and study area are illustrated in **Figure 1**.

- Niagara Falls Boulevard at Delta Sonic and Wegmans
- Niagara Falls Boulevard at East Robinson Road
- East Robinson Road at Naples Lane

3.0 TRANSPORTATION SETTING

3.1 Description of Study Area Roadways

The information outlined in **Table 1** provides a description of the existing roadway network within the study area. **Figure 2** illustrates the lane geometry, traffic controls at each of the study intersections, and the Annual Average Daily Traffic (AADT) volumes on the study roadways. The AADTs, in vehicles per day (vpd), reflect the most recently collected data obtained from the NYSDOT.

Functional classification of roadways is determined by the NYSDOT and the Federal Highway Administration (FHWA). Both the NYSDOT and FHWA groups roads, streets, and highways into different classes based on how they are used. This is called functional classification. Roads and streets do not work alone to move traffic. Instead, they form a network. Functional classification defines how each road or street fits into this network, how it provides access to nearby properties, and whether it is in an urban or rural area. The primary functional classifications within the study area:

- Urban Principal Arterial - Other (Class 14)

May 15, 2024

- Urban Local (Class 19)

Table 1: Existing Highway System

| Roadway | Class ¹ | Agency ² | Speed | Typical Cross Section ³ | AADT |
|---------------------------------|--------------------|---------------------|--------|------------------------------------|----------------------|
| Niagara Falls Boulevard (US-62) | 14 | NYSDOT | 40 mph | 4-lane w/ TWLTL | 29,282 (NYSDOT 2022) |
| East Robinson Road (CR-299) | 14 | County | 40 mph | 4-lane w/ TWLTL | 15,571 (NYSDOT 2022) |
| Naples Lane | 19 | Town | 30 mph | 2-lane undivided | 2,900 (Passero 2024) |

1. Functional Classification.
2. Roadway ownership.
3. Excludes turning lanes at intersections. TWLTL = Two-way left-turn lane.

3.2 Description of Multimodal Network

Table 2 summarizes the traffic controls, pedestrian, bicycle, and transit accommodations within the study area.

Table 2: Multimodal Network

| Feature | Niagara Falls Blvd @ Delta Sonic and Wegmans | Niagara Falls Blvd @ East Robinson Road | East Robinson Road @ Naples Lane |
|---------------------------|-------------------------------------------------|--------------------------------------------|-------------------------------------|
| Intersection Control Type | Signalized | Signalized | Unsignalized |
| Sidewalks | + | ++ | + |
| Crosswalks | ++ | ++ | + |
| Curb Ramps | ++ | ++ | + |
| Pedestrian Signal | ++ | ++ | Not Present |
| Pedestrian Actuation | ++ | ++ | Not Present |
| Pedestrian Countdown | ++ | ++ | Not Present |
| Bicycle Facilities | + | + | + |
| Street Lighting | ++ | ++ | + |
| Transit Route | Not Present | + | + |

- ++ Present at entire intersection
- + Present at portion of intersection

3.3 Planned/Programmed Highway Improvements

There are no planned/programmed highway improvement projects in the study area.

4.0 EXISTING CONDITIONS ANALYSIS

4.1 Peak Intervals for Analysis

Given the functional characteristics of the corridors, adjacent land uses, and the proposed land use for the project site, the peak hours selected for analysis are the weekday commuter AM and PM peak periods. The combination of site traffic and adjacent through traffic produces the greatest demand during these time periods.

4.2 Existing Traffic Volume Data

Passero Associates collected turning movement traffic counts on Tuesday, March 12, 2024. Traffic counts were conducted from 7:00-9:00 AM and 4:00 to 6:00 PM to determine peak hour traffic volumes at the study intersections. **Table 3** depicts the peak hours at each study intersection.

Table 3: *Study Intersection Peak Hours*

| Intersection | AM Peak Hour | PM Peak Hour |
|----------------------------------------------------|--------------|--------------|
| Niagara Falls Boulevard at Delta Sonic and Wegmans | 7:15-8:15 AM | 4:30-5:30 PM |
| Niagara Falls Boulevard at East Robinson Road | 7:30-8:30 AM | 4:15-5:15 PM |
| East Robinson Road at Naples Lane | 7:30-8:30 AM | 4:30-5:30 PM |

All traffic counts were collected on a typical weekday while local schools were in session. No significant adverse weather conditions impacted data collection. The traffic volumes were reviewed to confirm accuracy, seasonality, and relative balance between intersections. NYSDOT determines seasonality factors based on the month of the year, whether the data was taken during the week or weekend, and the factor group of the surrounding roadways, which is commuter dominated during the weekday for this project. Given the time of year the traffic counts were conducted, no seasonality adjustments were necessary. The actual differences in traffic volumes can be attributed to temporal variations in traffic volumes as well as activity related to driveways located in the segments between the study intersections. **Figure 3** illustrates the existing peak hour traffic conditions.

4.3 Field Observations

The study intersections were observed during peak intervals to assess current traffic operations. Signal timing and phasing information was obtained from the NYSDOT to determine peak hour phasing plans and phase durations during each interval at the signalized intersections of Niagara Falls Boulevard at Delta Sonic/Wegmans and East Robinson Road. This information was used to support and/or calibrate capacity analysis models described in detail later in this report.

4.4 Existing Crash Investigation

The purpose of this crash analysis is to identify inherent safety issues by studying and quantifying historical crashes at the study intersections and identifying potential crash patterns and clusters. A crash cluster is defined as an abnormal occurrence of similar crash types occurring at approximately the same location or involving the same geometric features. The severity of the crashes should also be considered. A history of crashes is an indication that further analysis is required to determine the cause(s) of the crash(es) and to identify what actions, if any, could be taken to mitigate the crashes.

Crash history data was obtained from MV-104A Police Accident Reports provided by the NYSDOT *Crash Location & Engineering Analysis & Reporting (CLEAR)* database. Intersection rates are listed as accidents (crashes) per million entering

May 15, 2024

vehicle (Acc/MEV). This study conducted the evaluation from August 31, 2018, through August 31, 2023. A summary of the crashes that occurred at intersection locations are shown in **Table 4**.

Table 4: Intersection Crash Rate Analysis

| Intersection | Total Crashes | Injury | ADT | Actual Crash Rate | Statewide Average Crash Rate |
|-----------------------------------------------|---------------|--------|------------|-------------------|------------------------------|
| Niagara Falls Blvd at Delta Sonic and Wegmans | 10 | 6 | 34,158 vpd | 0.16 | 0.26 |
| Niagara Falls Blvd at East Robinson Road | 81 | 28 | 42,768 vpd | 1.04 | 0.26 |
| East Robinson Road at Naples Lane | 3 | 2 | 17,442 vpd | 0.09 | 0.07 |

The Niagara Falls Boulevard at Delta Sonic/Wegmans and East Robinson Road at Naples Lane intersections are at or below the statewide average crash rate. However, given that the Niagara Falls Boulevard at East Robinson Road intersection experienced a higher crash rate compared to statewide averages, this intersection is discussed in greater detail.

Niagara Falls Blvd at East Robinson Road

| | | |
|--------------------|-----|-----------------|
| <i>Crash Types</i> | 51% | Rear End |
| | 17% | Left Turn |
| | 16% | Sideswipe |
| | 7% | Right Angle |
| | 5% | Right Turn |
| | 2% | Fixed Object |
| | 1% | Bike/Pedestrian |

Description There were 81 total crashes during the five-year study period. Most of the contributing factors for these crashes were ‘driver inattention’, ‘following too closely’, and ‘failure to yield the right-of-way’. The frequency of rear end crashes is characteristic of signalized intersections along moderate to heavily trafficked corridors, such as Niagara Falls Boulevard. Of the 41 rear end crashes, 18 occurred in the northbound direction, 14 occurred in the southbound direction, and six occurred in the westbound direction.

Potential Improvement Recent improvements were made to the intersection, such as installing backplates on the signal heads and converting the permissive/protected left-turn signal heads to flashing yellow. Additionally, the corridor speed limit was reduced from 45 mph to 40 mph within the past six years. There are no recommended geometric strategies. Potential operational improvement strategies may include optimizing the change and clearance intervals. This is an existing condition that, if addressed, should be led by the Town and/or NYSDOT and future applicants should not be made to bear the full expense of this improvement.

5.0 BACKGROUND (NO BUILD) CONDITIONS

Background traffic volumes represent the traffic conditions during the proposed build year without development of the project. Construction of the proposed project is anticipated to reach full build-out within three years. The widely accepted methodology for preparing traffic impact studies requires that any projects in the study area that are currently approved and/or under construction must be considered in the traffic analysis. Projects that are contemplated but not yet approved are not included in a traffic analysis. Local municipal personnel were contacted to discuss any other specific projects that are currently approved or under construction that would generate additional traffic in the study area. No nearby projects were identified.

A review of available historical NYSDOT traffic volume data in the vicinity of the site indicates that traffic has decreased between 2010 and 2019. To account for normal increases in background traffic growth, including any unforeseen developments in the study area, a growth rate of 0.5% per year was applied to the existing traffic volumes. **Figure 4** illustrates the background traffic conditions.

6.0 PROPOSED DEVELOPMENT CONDITIONS

6.1 Project Description

The project comprises the following components:

- **Proposed Land Uses:**
 - **Senior Housing (Single Family):** 40 units within five separate buildings.
 - **Senior Housing (Multifamily):** 232 units within two separate buildings (116 units each).
- **Access:** Access to the site will be provided via new driveways along East Robinson Road with cross access onto Naples Lane. Naples Lane traffic can access Niagara Falls Boulevard via the existing traffic signal servicing Wegmans and Delta Sonic.
- **Sidewalks:** Sidewalks are planned throughout the site with connections to East Robinson Road and the private access road to the north.

6.2 Proposed Traffic Generation

The volume of traffic generated by a site is dependent on the intended land use and size of the development. Trip generation is an estimate of the number of trips generated by a specific building or land use. These trips represent the volume of traffic entering and exiting the development. *Trip Generation Manual (11th Edition)* published by the Institute of Transportation Engineers (ITE) is used as a reference for this information. The trip rate for the peak hour of the generator may or may not coincide in time or volume with the trip rate for the peak hour of adjacent street traffic. Volumes generated during the peak hour of the adjacent street traffic and proposed land use, in this case, the weekday commuter AM and PM peak hours, represent a more critical volume when analyzing the capacity of the system; those intervals will provide the basis of this analysis. **Table 5** shows the trip generation estimates during the peak hours.

Table 5: Site Generated Trips

| Description | Size | AM Peak Hour | | PM Peak Hour | |
|------------------------------------------|-----------|--------------|-----------|--------------|-----------|
| | | Enter | Exit | Enter | Exit |
| Senior Housing - Single Family (ITE 251) | 40 units | 6 | 13 | 13 | 9 |
| Senior Housing - Multifamily (ITE 252) | 232 units | 16 | 30 | 32 | 26 |
| Total Trip Generation | | 22 | 43 | 45 | 35 |

The proposed project is expected to generate approximately 22 entering and 43 exiting vehicle trips during the AM peak hour with 45 entering and 35 exiting vehicle trips during the PM peak hour.

6.3 Trip Distribution

The cumulative effect of site-generated traffic on the transportation network is dependent on the origins and destinations of that traffic and the location of the access drives serving the site. The proposed arrival/departure distribution of traffic generated by the proposed project is considered a function of several parameters, including:

- Employment centers using U.S. Census Data
- Nearby commercial centers
- Proximity to recreational areas
- Site driveway locations
- Existing traffic patterns
- Existing traffic conditions and controls

Figure 5 shows the anticipated trip distribution pattern percentage for the project site. The analysis assumed 7% of site traffic will travel to/from Wegmans. **Figure 6** shows the total site generated trips based on the distribution patterns.

Aside from the 7% of traffic assumed to travel to/from Wegmans/Tops, an additional 18% is assumed to travel to/from Delta Sonic (3%) and areas north (15%). These assumptions are based on existing collected traffic volumes at both Naples Lane and the Wegmans/Delta Sonic intersections and drivers potentially avoiding traveling on East Robinson due to the traffic signal at East Robinson and Niagara Falls Boulevard. Over time, site users may adjust their travel behavior and take the route with fewer delays.

6.4 Full Development Volumes

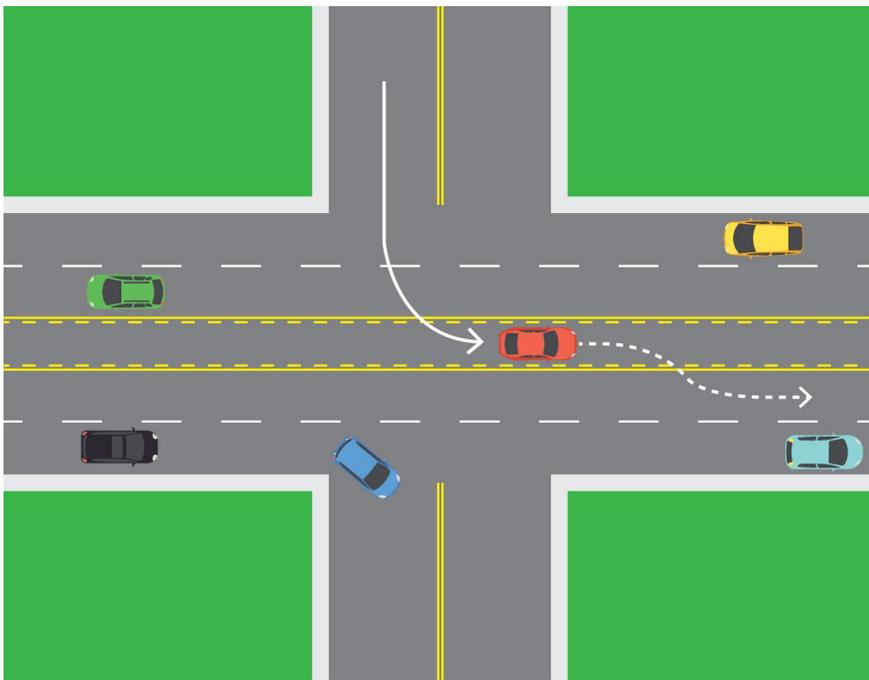

The proposed design hour traffic volumes are developed for the peak hours by combining the background traffic conditions (**Figure 4**) and the new site-generated traffic volumes (**Figure 6**) to yield the traffic volumes under full development conditions. **Figure 7** illustrates the full build traffic conditions.

7.0 TRAFFIC OPERATIONS AND ANALYSIS

7.1 Left-Turn Warrant Analysis

Left-turn warrants are typically based on Transportation Research Board's (TRB) *NCHRP Report 279 Intersection Channelization Design Guide*. Provisions for left-turn lane facilities should be established where traffic volumes are high enough and safety considerations are sufficient to warrant the additional lane. The left-turn warrants are based on a combination of the percentage of left-turning traffic, advancing traffic, opposing traffic, and the design speed of the major roadway (posted speed plus 5 mph) at the study intersection. In this case, there is an existing two-way left-turn lane (TWLTL) at the proposed driveways onto East Robinson Road benefiting drivers entering and exiting the site.

For example, drivers exiting the site can perform a two-stage left-turn maneuver. This can increase the number of prevailing traffic gap opportunities afforded to a driver as the driver, upon seeing an acceptable gap in traffic on the near side of the street (westbound East Robinson Road), can enter this space before proceeding into the far side traffic stream (eastbound East Robinson Road) when an acceptable gap in traffic is created. An example of this is shown in the following graphic.

TWLTL along major road at side roads.

7.2 Description of Capacity Analysis

Capacity analysis is a technique used for determining a measure of effectiveness for a section of roadway and/or intersection based on the number of vehicles during a specific time period. The measure of effectiveness used for the capacity analysis is referred to as a Level of Service (LOS). Levels of service are calculated to provide an indication of the amount of delay that a motorist experiences while traveling along a roadway or through an intersection. Since the most amount of delay to motorists usually occurs at intersections, capacity analysis focuses on intersections, as opposed to highway segments.

The standard procedure for capacity analysis of signalized and unsignalized intersections is outlined in the *Highway Capacity Manual (HCM) 7th Edition* published by the TRB. Traffic analysis software, Synchro 12, which is based on procedures and methodologies contained in the HCM, was used to analyze operating conditions at study area intersections. The procedure yields a level of service based on the HCM as an indicator of how well intersections operate.

Six levels of service are defined for analysis purposes. They are assigned letter designations, from "A" to "F", with LOS "A" representing the conditions with little to no delay, and LOS "F" conditions with very long delays. LOS "C" or better is desirable, but LOS "D" for signalized locations and LOS "E" for unsignalized locations are generally thresholds of acceptable operation during peak periods so long as the volume to capacity ratio (v/c) is below 1.0. **Table 6** depicts level of service criteria for both signalized and unsignalized intersections.

Table 6: *Level of Service Criteria*

| Level of Service | Signalized Control Delay per Vehicle (seconds) | Stop Control Delay per Vehicle (seconds) |
|------------------|---------------------------------------------------|---------------------------------------------|
| A | < 10 | < 10 |
| B | 10 – 20 | 10 – 15 |
| C | 20 – 35 | 15 – 25 |
| D | 35 – 55 | 25 – 35 |
| E | 55 – 80 | 35 – 50 |
| F | > 80 | > 50 |

LOS for signalized intersections is defined in terms of delay specifically, average total delay per vehicle for a 15-minute analysis period. LOS for unsignalized intersections, however, are different from a signalized intersection. The primary reason for this is driver expectation that a signalized intersection is designed to carry higher volumes than an unsignalized intersection. Unsignalized intersections are also associated with more uncertainty for users, as delays are less predictable than they are at signals.

The v/c ratio, also referred to as degree of saturation, represents the sufficiency of an intersection to accommodate the vehicular demand. A v/c ratio less than 0.85 generally indicates that adequate capacity is available, and vehicles are not expected to experience significant queues and delays. As the v/c ratio approaches 1.0, traffic flow may become unstable, and delay and queuing conditions may occur.

7.3 Capacity Analysis Results

Existing and background operating conditions during the peak study periods are evaluated to determine a basis for comparison with the projected future conditions. Future traffic conditions generated by the project are analyzed to assess the operation of the study area intersections. **Table 7** describes the capacity results for existing, background, and full development conditions. The discussion following the table summarizes capacity conditions.

Table 7: Capacity Analysis Results

| Intersection | 2024 Existing Base Conditions | | | | 2027 Background Conditions | | | | 2027 Full Build Conditions | | | |
|---------------------------------------------------------|-------------------------------|-------------|-------------|-------------|----------------------------|-------------|-------------|-------------|----------------------------|-------------|-------------|-------------|

A(2.8) = Level of Service (Delay in seconds per vehicle)

(S) = Signalized; (U) = Unsignalized

NB = Northbound, SB = Southbound, EB = Eastbound, WB = Westbound

N/A = Approach does not exist and/or was not analyzed during this condition

Green shaded cells indicate low delays, yellow shaded cells indicate moderate delays, red shaded cells indicate long delays.

1. Niagara Falls Boulevard at Delta Sonic and Wegmans

The Niagara Falls Boulevard corridor is heavily traveled and turning movements can experience moderate to long delays during the commuting peak hours. Notably, the eastbound and westbound approaches at this intersection during both peak hours experience long delays. Existing and projected background levels of service for the westbound left and left/through movements operate at F during the AM and PM peak hours. The remaining movements generally operate at LOS an acceptable C or better. The overall LOS is B during the AM peak hour and C during the PM peak hour and remains unchanged under background conditions.

Very minor increases in delays are projected under full build conditions during the peak hours. The proposed project constitutes less than 0.63% of total peak hour traffic during either peak hour. The additional traffic volumes generated by the proposed project can be accommodated, as there is available intersection capacity. Therefore, no improvements are warranted nor recommended under full build conditions.

2. Niagara Falls Boulevard at East Robinson Road

Most movements operate at LOS D or better during both peak hours under existing conditions. The exceptions are the eastbound left (PM peak hour), eastbound through/right (AM and PM peak hour), westbound through/right (PM peak hour), and southbound left (PM peak hour). Minor signal timing changes are recommended under background conditions during the AM peak hour and consist of reallocating the green time for the eastbound and westbound left-turn movements.

Very minor increases in delays are projected under full build conditions during the peak hours. The proposed project constitutes less than 0.89% of total peak hour traffic during either peak hour. The additional traffic volumes generated by the proposed project can be accommodated. Therefore, no improvements are warranted nor recommended under full build conditions.

3. East Robinson Road at Proposed Westerly Driveway

All movements are projected to operate at LOS B or better during both peak hours. No capacity improvements are warranted nor recommended under full build conditions.

4. East Robinson Road at Proposed Easterly Driveway

All movements are projected to operate at LOS B or better during both peak hours. No capacity improvements are warranted nor recommended under full build conditions.

5. East Robinson Road at Naples Lane

All movements operate at an acceptable LOS D or better during both peak hours under existing and projected background conditions. Very minor increases in delays are projected under full build conditions during the peak hours. The additional traffic volumes generated by the proposed project can be accommodated, as there is available intersection capacity. Therefore, no improvements are warranted nor recommended under full build conditions.

May 15, 2024

8.0 CONCLUSIONS AND RECOMMENDATIONS

This Traffic Impact Report identified and evaluated the potential traffic impacts that can be expected from the proposed East Robinson Residential project. The results of this comprehensive study determined that the existing transportation network can adequately accommodate the projected traffic volumes and resulting minor impacts to study area intersections. The following sets forth the study's conclusions and recommendations:

1. The proposed project consists of constructing a mix of senior housing (232 units) and townhomes/duplexes (40 units). Access to the site will be provided via new driveways along East Robinson Road with cross access onto Naples Lane. Naples Lane traffic can access Niagara Falls Boulevard via the existing traffic signal servicing Wegmans and Delta Sonic.
2. Sidewalks are proposed throughout the site with proposed off-site connections provided to Wegmans to the north, the Tops Plaza to the west, and the existing sidewalk along East Robinson Road to the south.
3. The proposed project is expected to generate approximately 22 entering and 43 exiting vehicle trips during the AM peak hour with 45 entering and 35 exiting vehicle trips during the PM peak hour.
4. Section 4.4 describes the results of the crash investigation. Rear end crashes were the predominant crash type at the intersection of Niagara Falls Boulevard and East Robinson Road. Crashes of this nature are characteristic of signalized intersections with moderate to high traffic volumes. There are no recommended geometric strategies for improvement of the existing condition. This is an existing condition that, if addressed, should be undertaken by the Town and/or NYSDOT.
5. Very minor increases in delays are projected under full build conditions during the peak hours at the existing study intersections. The proposed project constitutes less than 0.89% of total peak hour traffic during either peak hour at the signalized intersections of Niagara Falls Boulevard at Delta Sonic/Wegmans and East Robinson Road. The additional traffic volumes generated by the proposed project can be accommodated. Therefore, no improvements are warranted nor recommended under full build conditions.
6. The proposed driveways are projected to operate at LOS B or better during the AM and PM peak hours. No capacity improvements are warranted nor recommended under full build conditions.

Intersection Summary

Area Type: Other
 Cycle Length: 160
 Actuated Cycle Length: 160
 Offset: 0 (0%), Referenced to phase 2:NBTL and 6:SBTL, Start of Yellow
 Natural Cycle: 145
 Control Type: Actuated-Coordinated
 Maximum v/c Ratio: 0.75
 Intersection Signal Delay (s/veh): 15.8 Intersection LOS: B
 Intersection Capacity Utilization 74.8% ICU Level of Service D
 Analysis Period (min) 15
 m Volume for 95th percentile queue is metered by upstream signal.

Splits and Phases: 1: Niagara Falls Boulevard & Delta Sonic Driveway/Wegmans Driveway

Lanes, Volumes, Timings
 2: Niagara Falls Boulevard & East Robinson Road

Intersection Summary

Area Type: Other
 Cycle Length: 180
 Actuated Cycle Length: 180
 Offset: 0 (0%), Referenced to phase 2:NBTL and 6:SBTL, Start of Yellow
 Natural Cycle: 135
 Control Type: Actuated-Coordinated
 Maximum v/c Ratio: 0.84
 Intersection Signal Delay (s/veh): 29.8 Intersection LOS: C
 Intersection Capacity Utilization 78.9% ICU Level of Service D
 Analysis Period (min) 15
 m Volume for 95th percentile queue is metered by upstream signal.

Splits and Phases: 1: Niagara Falls Boulevard & Delta Sonic Driveway/Wegmans Driveway

Intersection Summary

Area Type: Other
 Cycle Length: 160
 Actuated Cycle Length: 160
 Offset: 0 (0%), Referenced to phase 2:NBTL and 6:SBTL, Start of Yellow
 Natural Cycle: 145
 Control Type: Actuated-Coordinated
 Maximum v/c Ratio: 0.75
 Intersection Signal Delay (s/veh): 16.7 Intersection LOS: B
 Intersection Capacity Utilization 75.9% ICU Level of Service D
 Analysis Period (min) 15
 m Volume for 95th percentile queue is metered by upstream signal.

Splits and Phases: 1: Niagara Falls Boulevard & Delta Sonic Driveway/Wegmans Driveway

Lanes, Volumes, Timings
 2: Niagara Falls Boulevard & East Robinson Road

Intersection Summary

Area Type: Other
 Cycle Length: 160
 Actuated Cycle Length: 160
 Offset: 0 (0%), Referenced to phase 2:NBTL and 6:SBTL, Start of Yellow
 Natural Cycle: 110
 Control Type: Actuated-Coordinated
 Maximum v/c Ratio: 0.92
 Intersection Signal Delay (s/veh): 42.7 Intersection LOS: D
 Intersection Capacity Utilization 85.1% ICU Level of Service E
 Analysis Period (min) 15
 # 95th percentile volume exceeds capacity, queue may be longer.
 Queue shown is maximum after two cycles.

Splits and Phases: 2: Niagara Falls Boulevard & East Robinson Road

Intersection Summary

Area Type: Other
 Cycle Length: 180
 Actuated Cycle Length: 180
 Offset: 0 (0%), Referenced to phase 2:NBTL and 6:SBTL, Start of Yellow
 Natural Cycle: 135
 Control Type: Actuated-Coordinated
 Maximum v/c Ratio: 0.84
 Intersection Signal Delay (s/veh): 31.0 Intersection LOS: C
 Intersection Capacity Utilization 80.0% ICU Level of Service D
 Analysis Period (min) 15
 m Volume for 95th percentile queue is metered by upstream signal.

Splits and Phases: 1: Niagara Falls Boulevard & Delta Sonic Driveway/Wegmans Driveway

 Maximum v/c Ratio: 0.95
 Intersection Signal Delay (s/veh): 55.9 Intersection LOS: E
 Intersection Capacity Utilization 98.1% ICU Level of Service F
 Analysis Period (min) 15
 # 95th percentile volume exceeds capacity, queue may be longer.
 Queue shown is maximum after two cycles.

Splits and Phases: 2: Niagara Falls Boulevard & East Robinson Road

Lanes, Volumes, Timings
 3: East Robinson Road & Proposed Westerly Driveway
